

Solar Check List

DID YOU FORGET?...

1) A **battery** for your solar system

-A 12V deep cycle (Marine or RV) battery is recommended.

2) A **charge controller** for battery protection

3) An **inverter** to use AC power with your solar system

-The size you choose depends on the Watts (or Amps) of what you wish to run with your system. It is recommended to buy an inverter at least 10 – 20% more than your largest start up load.

4) Proper wiring for your system

- Correct wiring is very important when installing a solar kit. The wiring included in the retail box of your panel may only be sufficient for wiring one panel at a time. Please consult an electrician or one of the following two tables for detailed information; http://www.windsun.com/Hardware/Wire_Table.htm, <http://www.rbeelectronics.com/wtable.htm>.

How Solar Works
